WebbWing White Paper

Platform vision and token launch plan

Foundation edition 0.1 | Expanded September 25, 2026

webbwingtrade.com

Project overview

We are building WebbWing to make exploring crypto and global markets feel like an adventure. Our vision brings useful discovery tools into an interactive three-dimensional web, guided by a winged spider with a world and story of its own. We want visitors to enjoy exploring, discover resources they can use, and return as the platform develops.

The foundation is a network of connected market hubs. These hubs bring cryptocurrency resources, exchanges, meme coin launchpads, blockchain networks, and broader market destinations into one visual environment. The public preview establishes the discovery experience; a WebbWing Wallet and additional research and account tools form part of the development plan.

We plan to launch a WebbWing project token through Pump.fun. Our proposed funding model directs creator fees received by the project toward token buybacks and burns and the costs of building and operating WebbWing. This paper explains that model, the platform experience, and the decisions that remain open before launch.

Why we are building WebbWing

Research can involve moving among exchange pages, token launchpads, analytics tools, and separate community channels. WebbWing is designed to give those destinations a recognizable place in a shared environment, making it easier to explore a topic and find related resources.

The visual world also gives the project room for creativity. The spider, its journey, and the origin story create a consistent identity around the practical discovery tools. Our ambition is to offer one of the most enjoyable and distinctive ways to explore the crypto community, while making the purpose of each destination clear.

Who the platform is for

WebbWing is intended for people discovering crypto, experienced users organizing market resources, and communities looking for meme coin launchpads and related information. Visitors should be able to understand what a hub offers before choosing to open an external service.

This edition describes the preview and proposed development direction. The token launch, fee allocations, and future wallet functions remain subject to final configuration and release announcements.

The WebbWing experience

Explore the living web

The web is the organizing structure of the platform. Each hub represents a destination or topic, and the WebbWing spider provides a recognizable guide between them. Search and directory tools complement the visual experience so visitors can find resources directly.

The intended immersive journey lets a visitor select a hub and follow the spider through the hollow core of a web strand toward that destination. Relevant information would appear along the inner walls during the journey, giving the visitor context before the hub opens. This deeper navigation experience is part of the development vision.

Platform area	Position in this edition
Market web and hubs	Public preview of the 3D web, market destinations, directory search, and spider journey.
Personalized hubs	The preview supports website hubs saved within the visitor's browser.
Meme coin launchpads	Discovery links to independent launchpads and token resources.
Story and character	An origin story introduces Spider Brain and the winged explorer.
WebbWing Wallet	In development; public release details remain to be announced.
WebbWing Terminal	Planned workspace for research and account tools; connections are pending and trading and wallet actions are not enabled.

Meme coin launchpad discovery

Launchpad hubs help visitors find platforms where communities create and explore meme coins. These destinations operate independently and set their own eligibility requirements, fees, and token rules. A launchpad listing does not establish a partnership or make WebbWing the operator of that launchpad.

Wallet development and market information

The planned WebbWing Wallet would extend the platform beyond discovery. Supported networks, how assets and keys would be controlled, security design, and release timing remain to be announced. This paper does not present the wallet as available for public use.

Market information needs clear context. Some preview data is dated and marked as not live. Development priorities include making sources and update times easy to identify so visitors can distinguish current information from demonstrations or older snapshots.

Token launch and token information

Planned token launch

We plan to launch the WebbWing project token through Pump.fun on Solana. Using an established launch process is intended to keep initial platform creation costs low and give the community a defined place to find the official token once the launch is announced.

Pump.fun currently lists its coin creation platform fee as 0 SOL or 0 USDC. Network, trading, graduation, and other applicable costs can still arise. Its fee schedule can change, so the settings and costs in effect at launch will govern the actual process. [1]

The proposed role of the token

The initial concept is a community token associated with WebbWing and its identity. The project's intended funding mechanism is the allocation of eligible creator fees to development costs and token buybacks and burns. Any future access features, rewards, or other token uses would need a separate, published specification before they could be treated as available benefits.

This edition does not establish equity, dividend rights, distributions of project revenue, or token-holder control of project spending. A token purchase would not guarantee that a planned platform feature will be delivered.

Launch item	Position in this edition
Project and website	WebbWing | webbwingtrade.com
Launch platform and network	Pump.fun on Solana is the planned route.
Token name and symbol	Final token name and ticker to be confirmed.
Supply and configuration	Total supply, selected launch settings, and any relevant token authorities to be disclosed.
Holdings and distribution	Team and treasury holdings, initial purchases, and any vesting arrangements to be disclosed.
Official token address	To be published with the verified launch link.
Launch date	To be announced.

Official launch information

The launch announcement should bring together the verified token address, Pump.fun link, token configuration, and final fee policy on webbwingtrade.com. The token address identifies the asset; a matching name or logo alone is not sufficient verification.

No fixed token allocation, presale structure, vesting schedule, or exchange listing is established by this edition. Those details should be published when the actual launch configuration is finalized.

Creator fees and project funding

How the proposed allocation works

Our intended model divides creator fees actually received by WebbWing between two purposes: purchasing and burning project tokens, and covering project costs. The allocation applies to the project's creator receipts, rather than total trading volume or every fee charged by a trading platform.

Pump.fun distinguishes creator fees from protocol and liquidity fees. The amount available to WebbWing depends on the applicable rules and token configuration. The selected launch settings must support the intended creator fee stream. [1]

Allocation	Intended use	Share
Buybacks and burns	Purchase WebbWing tokens and permanently remove the purchased tokens from supply through a verifiable burn.	To be confirmed
Project costs	Fund development, hosting, data services, wallet work, security, design, community support, and other disclosed project expenses.	To be confirmed

Receipts and execution

Under the proposed process, creator fees would be recorded when received. The published allocation percentages would determine the amount assigned to each purpose. Transaction and execution costs would be recorded against the relevant allocation so that receipts, spending, and remaining balances can be reconciled.

The buyback allocation would fund purchases of the project token. A purchase by itself is not a burn. The tokens would then need to be burned through a verifiable transaction, or through a mechanism that demonstrably completes both steps. Tokens simply held in a project wallet would remain separate from the reported burn total.

The project cost allocation would support the work required to maintain and expand WebbWing. Spending would depend on available funds and development priorities. Creator fee income is variable, and it may be insufficient to support all proposed features or operating expenses.

Public records and controls

The proposed funding record would show fees received, allocations, buyback spending, tokens purchased, tokens burned, transaction references, expenses by category, and unspent balances. A report should distinguish funds reserved for an activity from transactions that have actually been completed.

The final policy should identify the receiving wallets, who controls them, the allocation percentages, execution method, and reporting schedule. It should also explain how changes are announced and how funds are treated during any pause in buybacks or development.

This is a proposed operating model. It does not establish an automated or immutable system. Execution depends on receipts, liquidity, transaction costs, and the final policy. Buybacks and burns do not guarantee price increases, a minimum token value, or returns to holders.

Development roadmap and participation

Stage one Strengthen the public preview

Refine hub navigation and the spider journey, maintain useful directory information, and improve clarity about data sources and freshness. Community feedback can help identify confusing navigation, missing destinations, and practical improvements to the experience. The priority is to make exploration useful as well as enjoyable.

Stage two Prepare the token and funding policy

Finalize the launch configuration, token identity, and creator fee arrangement. Publish the official token address and launch link, disclose relevant holdings and distribution details, and establish the allocation percentages and wallet responsibilities. Prepare a public record for receipts, purchases, burns, project expenses, and remaining balances.

Stage three Expand platform capabilities

Continue wallet development and research tools, including the planned WebbWing Terminal. Define supported networks, asset control, and security arrangements before introducing public wallet or transaction functions. The release scope should reflect what has been built and tested. The roadmap sets a proposed sequence; fixed delivery dates have not been established.

Community participation and accountability

We want the community to help shape WebbWing through feedback on the platform, hub suggestions, and creative participation around its character and story. Community involvement can inform development priorities, but this edition does not create a token-based voting system or assign spending authority to token holders.

Progress updates should identify completed work, work in development, and changes to the roadmap. The same distinction should apply to project funding: announced plans, allocated funds, and completed transactions should remain separately visible.

Participation and platform limits

WebbWing's preview serves market discovery and navigation. It does not provide brokerage, custody, or trade execution. Third-party listings are not endorsements, and the services linked through a hub remain subject to their own terms and operating conditions.

Crypto assets and meme coins can lose all their value. Limited liquidity, price volatility, compromised wallets, and smart contract failures can cause losses. Future features and fee-funded activities may be delayed, changed, or discontinued. This paper describes a project direction and does not promise investment returns.
